

Instead of a traditional 5 minutes guide we wrote a more simpler 4 STEPS guide that will guide you from installation to administration in 4 easy steps:

1. Install cubeSQL using the appropriate Installer for your Operating System.
2. Start cubeSQL using the Preference Panel (on MacOS X), or using the Service Manager (under Windows) or with the `sudo cubesqlctl start` (on Linux).
3. Start the Admin application located in your Application folder (on MacOS X) or in the Start menu (on Windows) or in `/opt/cubesql` (on Linux).
4. Connect to a running server using the default values (default username is admin and default password is admin).

Now you can read the Admin Manual in order to fully understand how to administer your server and how to register it and then read the Language Reference in order to know all the custom commands recognized by the server.
